

Homework 6

In each of HW6a and HW6b, say what is printed by each line with a "Qx" next to it, where "x" is a natural number. If the statement is an error, either at compile or runtime, answer "Err", and continue to the following statements as if the erroneous statement was not part of the program. If nothing is printed, answer "Ok".

You can either put your answers into a file and turn that in, or you can write your answers on a piece of paper and either turn in a .jpg or a scan of the paper.
